

## User Manual

# ***tSENSE (Disp) T RH RL***

CO<sub>2</sub>- , temperature- and  
relative humidity transmitter

### **General**

*tSENSE (Disp)* for wall mounting measures indoor air carbon dioxide concentration, temperature and relative humidity in rooms. *tSENSE (Disp)* is available with or without colour touch display (LCD).

The unit connects to Direct Digital Control (DDC).

Linear outputs are pre-programmed as CO<sub>2</sub>- , temperature- and relative humidity transmitter. Measuring ranges can be modified from PC (Windows) software UIP (version 5 or higher) and USB communication cable, alternative via Modbus or BACnet.

<b>UIP Baud rate</b> 			
			
<b>1</b> Misc	<b>2</b>	<b>3</b>	<b>3</b>
			

## Connection configurations

<b>1</b>	<b>2</b> ModBus <b>3</b> Choose SenseAir Cable if bought from SenseAir, otherwise choose COM Port <b>4</b> Save
	
<b>5</b> Lower right corner of screen	<b>6</b>
	

### NOTE!

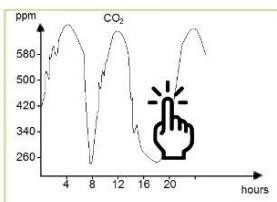

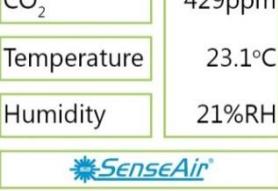

UIP baud rate ≠ RS-485 baud rate if [tSENSE \(Disp\)](#) is connected via phone jack (see fig. 2).

UIP baud rate = RS-485 baud rate if [tSENSE \(Disp\)](#) is connected via screw terminal (see fig. 3).

RS-485 Protocol parameter set to "Auto": the sensor selects protocol depending on the protocol used on the network it is connected to. After power on the sensor then listens to the traffic on the RS-485 network. If the sensor detects valid BACnet or Modbus messages the sensor will start to use the detected protocol. Change communication settings via UIP requires Reset (Power OFF – Power ON) to be executed.

## Automatic system test

A full system test is executed automatically at every power-up. Sensor probes are checked constantly during operation against failure by checking valid dynamic measurement ranges.

System checks returns error bytes to RAM. Error codes are available by connecting the sensors to a PC with a special USB cable (art.no. 00-0-0070) connected (see fig. 2). Error codes are shown in the display at "Meter status" and in software UIP (version 5 or higher).

## Error codes and action plans

Error symbol (a wrench appears when one or several error codes are active)

Bit #	Error code	Error description	Suggested action
0	CO <sub>2</sub> sensor Com. error	No ability to communicate with CO <sub>2</sub> sensor module.	Try to restart sensor by power OFF - power ON. Contact local distributor.
1	CO <sub>2</sub> sensor CO <sub>2</sub> measure error	CO <sub>2</sub> measurement error.	Try Background calibration ("Calibration options CO <sub>2</sub> " p.16). Contact local distributor. See Note 1!
2	T sensor T measure error	Temp measurement error.	
3	RH/T sensor com error	No ability to communicate with RH/T sensor module.	
4	RH/T sensor RH measure error	RH measurement error.	
5	RH/T sensor T measure error	Temp measurement error, sensor will use CO <sub>2</sub> sensor temperature if RH/T Temperature is unavailable. S_Temp will be set to NTC_Temp.	Try to restart sensor by power OFF - power ON.  Contact local distributor.
6			
7			
8	Output config. error	Error in output configuration. Output is still updated, i.e. can be 0-10V	Check connections and loads of outputs. Check detailed settings and configuration with UIP software version 5 or higher.  Contact local distributor.
9	Memory error	One or several bytes of sensors parameter memory (settings) are corrupt	Try to restart sensor by power OFF/ON Contact local distributor.

Table 2: Error codes and action plans.

### NOTE!

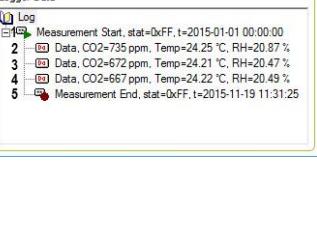

Occurs if probe is out of range, at very high CO<sub>2</sub> values. Error code resets automatically when measured values returns to normal. May also indicate need of zero point calibration. If CO<sub>2</sub> values are normal and error code remains, the sensor can be defect or the connections to it are broken.

If several errors are detected at the same time, different error code numbers will be added together into one single error code!

Sensor accuracy is defined at continuous operation (at least three (3) weeks after installation).

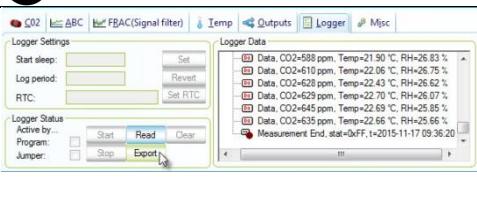

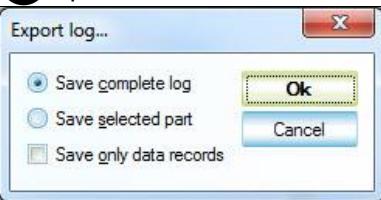

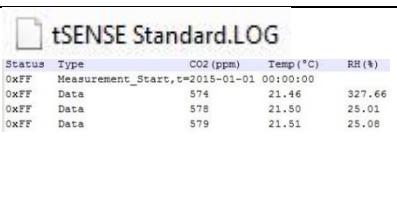

## UIP Logger

### Alternative 1

<p><b>1</b> Start to Read Log Data from sensor</p> 	<p><b>2</b> Records for compatibility between UIP and other sensor types.</p> <p><b>NOTE!</b> Sensor has no timer.</p> 	<p>1 Measurement Start. Record added by UIP for compatibility between UIP and other sensor types. Status = dummy value Timestamp = dummy value</p> <p>2 Oldest data record in log, average values for 15 minutes</p> <p>3 Average values for 15 minutes after point 2</p> <p>4 Measurement end. Record added to readout by UIP Status = dummy value Timestamp = time log was read from sensor</p>
--	--	---

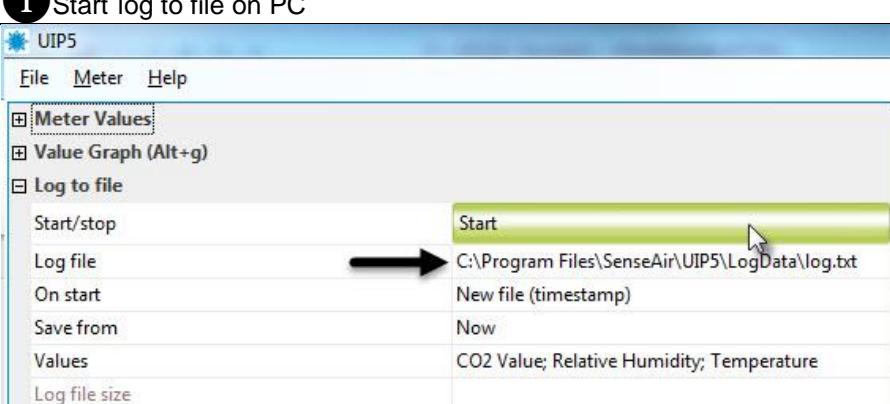

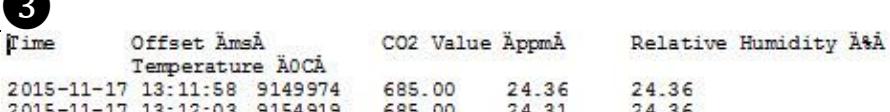

The sensor has no Real-time clock, if the sensor has not been powered on continuously, time between data points can be much longer than 15 minutes.

### Export Logger Data

Change PIN code for access to meter settings (PIN2)

5 PIN2	6 Create PIN2 Code	7 Save
		

## Maintenance

*tSENSE (Disp)* is maintenance free. Internal self-adjusting calibration (ABC) function takes care of normal long term drift. To secure highest accuracy, a time interval of five years is recommended between CO<sub>2</sub> calibrations, unless some special situations have occurred.

Software can be downloaded free at [www.senseair.com](http://www.senseair.com).  
USB-cable and zero calibration kit can be ordered from SenseAir.

Check can be done on site without interfering with ventilation system.
